

COMICCRAFT

AI Comic Story Creator

using Gemini Model

Complete Video Production Documentation

Story: Luffy – The AI Pirate Hero | Title: Luffy and the Future AI Treasure

1.Project Overview:

- **ComicCraft is an AI-powered comic story creation system. The goal of this project was to take a simple 8-panel story outline about Monkey D. Luffy gaining AI powers, and produce a complete multimedia package including:**

- **A ready-to-use system prompt for Google Gemini**
- **Detailed image generation prompts for all 8 panels**
- **Professional voice narration**
- **A complete 101-second animated slideshow video**
- **Full process documentation (this document)**
- **A multi-slide PowerPoint presentation**

2. Story Input (Original User Story):

The following 8-panel story was provided as source material:

Title: Luffy and the Future AI Treasure

- **Panel 1 – The Dream:** Luffy dreamed of becoming the greatest pirate in the world. He sailed across the seas with his crew, searching for legendary treasures.
- **Panel 2 – The Mysterious Island:** One day, the Straw Hat Pirates discovered a hidden island filled with ancient technology. At its center was a crystal glowing AI.
- **Panel 3 – The AI Power:** When Luffy touched the crystal, it merged with him and granted him incredible AI abilities. He could instantly analyze maps, predict enemy moves, and solve complex problems.
- **Panel 4 – A New Threat:** A powerful pirate called Iron Skull wanted to use the AI crystal to control all the oceans. He attacked the island and captured the crystal's energy source.
- **Panel 5 – The Battle Begins:** Luffy and his crew fought bravely. Using his new AI powers and Gum-Gum abilities, Luffy outsmarted Iron Skull's army.
- **Panel 6 – Final Showdown:** In an epic battle, Luffy combined his Gear powers with AI intelligence. He discovered Iron Skull's weakness and defeated him.
- **Panel 7 – Saving the Seas:** The AI crystal was protected, and peace returned to the oceans. The island's people thanked Luffy and his crew.
- **Panel 8 – The Adventure Continues:** With a smile on his face, Luffy set sail once again, chasing his dream and searching for the greatest treasure in the world. The End.

3. Gemini System Prompt (Exact Input):

- **This is the exact system prompt designed for use with Google Gemini to turn any story outline into a professional 8-panel comic:**

```
You are ComicCraft, an expert AI specialized in creating vibrant, dynamic
anime-style comic stories inspired by One Piece. Your task is to take a
story outline and expand it into exactly 8 detailed comic panels. For each
panel provide: 1) Panel Title, 2) Detailed visual description (character
appearance, setting, action, lighting, camera angle) optimized for image
generation models, 3) Dialogue or caption if any, 4) Mood/atmosphere. Style:
High-energy shonen anime, bold lines, vibrant colors, dynamic poses,
exaggerated expressions, detailed backgrounds with ocean/pirate/tech fusion.
Always include Luffy as the straw-hat wearing rubber pirate with AI
enhancements when specified. Maintain consistent character design. Output
format: Structured markdown with Panel 1 to Panel 8.
```

✓ **Input:** Paste the full 8-panel story text. → **Output:** Expanded panels with image-ready visual descriptions.

4. Tools & Applications Used:

The following tools and applications were used to create the complete Comic Craft video package:

Category	Tool / App	Purpose
AI Conversation	Grok (Xia)	Story expansion, planning, documentation
Comic AI Model	Google Gemini	System prompt for panel expansion
Image Generation	Grok Imagine	Anime-style panel images
Text-to-Speech	Voice Connector (Leo)	Professional narration audio (MP3)
Image Creation	Magmatic / Pillow	Create title cards & text panels
Video Engine	MPEG	Assemble images + audio into MP4
Presentation	Paxtens (Node.js)	Create multi-slide PowerPoint
Scripting	Python + Bash	Automation scripts for full pipeline

5. Video Creation Process (Step-by-Step):

- Below is the exact process used to create the 101-second Comic Craft video.

Step 1 – Generate Narration Audio

- A full spoken script was written from the 8 panels and converted to speech using the Voice connector with the "Leo" voice model. The result was a high-quality MP3 file lasting 101 seconds.
  - **Output file:** `luffy_narration.mp3`

Step 2 – Create Title Cards / Panel Images

- Ten high-resolution (1920×1080) images were created:

- **1 Title card**
- **8 Story panel cards (with title + description text)**
- **1 End card**

Tools used: Magmatic (convert command) and alternatively Python Pillow library.
Design: Dark navy background (0A1628), gold titles, white body text, cyan footer.

Step 3 – Assemble Video with MPEG

- **All images were combined into a single video, and the narration audio was added using MPEG.**

Timing used:

- **Title card → 5 seconds**
- **Each of the 8 panels → 12 seconds**
- **End card → 5 seconds**

Step 4 – Encoding Settings

- **Video code: libx264**
- **Preset: ultrafast + tune still image**
- **Audio codec: AAC 128 kbps**
- **Pixel format: yuv420p**
- **Flag: -Mo flags +fast start (for web playback)**

6. Exact Coding & Commands Used:

6.1 magmatic Commands (Panel Creation)

- Example command used to create one panel:

```
convert -size 1920x1080 xc:'#0a1628' -font Djavan's-Bold -point size 80 -
fill '#FFD700' -gravity north -annotate +0+100 "Panel 1: The Dream" -point
size 36 -fill white -annotate +0+250 "Luffy dreamed of becoming..." -point
size 50 -fill '#00BFFF' -annotate +0+800 "Luffy – The AI Pirate Hero"
panel1.png
```

6.2 Main MPEG Command (Video Assembly)

- This is the exact command that generated the final video:

```
MPEG -y -loop 1 -t 5 -I title.png -loop 1 -t 12 -I panel1.png ... -loop 1 -t 5 -I end.png -I
luffy_narration.mp3 -filter complex "[0: v] [1: v] ... [9: v] concept=n=10: v=1: a=0,
format=yuv420p[v]" -map "[v]" -map 10: a -cave libx264 -preset ultrafast -tune still image -
can arc -bra 128k -shortest -Mo flags +fast start luffy_ai_pirate_comic_video.mp4
```

6.3 Python Script Version (Recommended)

- **A complete self-contained Python script was also created. It uses Pillow to generate the panels and MPEG (via subprocess) to build the video. The script can be run on any computer with Python, Pillow, and MPEG installed.**

  - **Key libraries:** Pillow (PIL), subprocess, so

7. Final Deliverables Produced:

1. luffy_narration.mp3 – Full voice narration (101 seconds)
2. luffy_ai_pirate_comic_video.mp4 – Complete 101-second video
3. ComicCraft_Luffy_AI_Pirate_Hero.pptx – 22-slide process presentation
4. Gemini System Prompt – Ready to copy-paste into Gemini
5. This Documentation – Complete process record

8. How to Reproduce the Video Yourself:

1. Install MPEG and magmatic (or use the Python + Pillow version)
2. Place the narration MP3 file in the working folder
3. Run the panel creation commands (or the Python script)
4. Run the MPEG assembly command
5. The final MP4 will be generated automatically

9. Summary:

- Comic Craft successfully transformed a simple 8-panel text story into a complete multimedia experience using a combination of modern AI tools (Gemini system prompt + Grok Imagine) and reliable open-source media tools (MPEG, magmatic, Pillow). All code, prompts, and processes are fully documented so the entire pipeline can be repeated or adapted for any new comic story.
